(GERL/) ELLE/ Novel polypeptides and nucleic acids which are members of epidermal growth factor, complement receptor families for diagnosing and treating psychiatric conditions, depression, stroke, Alzheimer's and Parkinson's

Example 6; Page 84; 91pp; English.

The invention describes an isolated POLXX (POLY1-17) polypeptide and its variant. POLYX polypeptides (especially POLY5, POLY6 and POLY7), the bordy variant. POLYX polypeptides (especially POLY5, POLY6 and POLY7), the useful for treating or preventing a pathology associated with POLYX dispeptide in humans and for treating a syndrome associated with human disease. POLYX polypeptide is also useful for identifying an agent that collected to aberrant of personner or physiological interactions of the polypeptide (III) is expression or physiological interactions of the polypeptide (III) is useful for treating a pathological state in a mammal and for determining the presence or amount of POLYX in a sample. POLY1-4 (GABA receptor-like presence or amount of POLYX in a sample. POLY1-4 (GABA receptor-like presence or amount of POLYX in a sample. POLY1-4 (GABA receptor-like proteins) are useful for the treatment of psychiatric and medical conditions, depression, stroke, parkinson's disease, Huntington's disease. Tourette's syndrome, amyotrophic lateral sclerosis, head trauma, epileptogenic activity and memory functions, cardiomyopathy and standard adiabates. DoLY5-8 (Epidermal growth epileptogenic activity and memory functions, cardiomyopathy and expoteins) may be useful for treatment of lenkaemia, and grogenesis, renal disease and diabetes. POLY12 (haematopoietic stem and developmental disorders. POLY14-16 (Syntexin-like proteins) may be useful for treatment of Lambert-Eaton myasthenic syndrome, asthma, mixotic in treatment of Lambert-Eaton myasthenic syndrome, asthma, mixotic in treatment of Lambert-Eaton myasthenic syndrome, asthma, mixotic in modulators of POLY3 (POLYX protein and for identifying and be useful for producing normand/or activity of POLYX protein activity. This sequence represents a POR prime the invention and variance of polyx protein activity. This sequence represents a POR

This sequence represents a primer used to analyse the human endogenous retrovirus (HERV) W genome (AAX25665). Nucleic acids, their fragments or peptides encoded by them derived from the HERV-W genome are markers of autoimmune disease (e.g. multiple sclerosis, rheumatoid polyarthritis, disseminated lupus erythematosus, insulin-dependent diabetes and related atthologies) and of abnormal or unsuccessful pregnancy and can be used as chromosomal markers for susceptibility to these conditions, or proximity markers of genes associated with this susceptibility
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New nucleic acid sequences from human endogenous retrovirus-W - expressed exclusively in placenta and useful in diagnosis and therapy of autoimmune disease, and abnormal or failed pregnancy.
                                                                                                                                                                                                                                                                                                                                        Clone; human endogenous retrovirus; genome; autoimmune disease; primer; multiple sclerosis; rheumatoid polyarthritis; insulin-dependent diabetes; disseminated lupus erythematosus; pregnancy; chromosomal marker; PCR; amplification; ss.

The invention is useful as vaccine and in gene therapy. The nucleic acid is useful for preparing a composition for treating or preventing e.g., tumour or inflammatory disorder. The present sequence is human PCR primer for the expression of POLY11 DNA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           PCR primers AAZ01426-Z06209 were used to amplify open reading frames cocke by the genome of Chlamydia trachomatis (see AAZ01425). These ORFs encode polypeptides (see AAX36794-Y37949) which can be used as vaccines against Chlamydia trachomatis. Antisense and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases such as conventional trachoma, nonendemic trachoma, paratrachoma, and inclusion epidymitis, genital diseases such as nongonococcal uretritis, epidymitis, cervicitis, salpingitis, perihepatitis, bartholinitis, menococcal broad trachomatical and veneral lymphographlomatosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Respiratory disease; pneumonia; bronchitis; heart disease; sarcoidosis; sinusitis; purulent otitis media; erythema nodosum; pharyngitis; vaccine; neutralising epitope; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            the polypeptides of the invention may be of use in treating these

                                                                                                                                                                                                                                                                                    AAX91991-X97517 represent PCR primers used to amplify open reading frames and other nucleic acid sequences from the genome of Chlamydia pneumoniae (see AAX91990). C. pneumoniae causes respiratory disease such as pneumonia and bronchitis and is thought to be a contributing factor in heart disease, sarcoidosis, sinusitis, purulent otitis media, erythema nodosum or pharyngitis. The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see AAX94884- AAX98979) can be used in immunogenic compositions as vaccines. Vectors containing C. pneumoniae process of the compositions as a seed of mucleotides sequences can also be used as immunogenic compositions,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Antisense oligonucleotide; phosphorothioate; TNFalpha; cytokine; inhibit; tumour necrosis factor alpha; inflammatory bowel disease; diabetes; rheumatoid arthritis; infectious disease; multiple sclerosis; hepatitis; pancreatitis; atopic dermatitis; allograft rejection; autoimmune disease;

This sequence represents a PCR primer for the Survivin gene. The invention relates to an assay system for identifying the product or products of, in combination, the parcreas regenerating gene (REG) and the survivin gene (an anti-apoptosis gene) for determining the tendency of a Survivin gene (an anti-apoptosis gene) for determining the rendency of a caristing cancer. The assay determines the tendency of a tissue to become cancerous or the aggressive nature of an anti-apoptosis gene. The assay determines the tendency of a tissue to become cancerous or the aggressive nature of cancer tissue by using the gene products of the REG and Survivin genes. It is also used for diagnosing a patient, preferably having colorectal cancer for adjuvant therapy. These combined marker genes (REG and Survivin) are also used for screening individuals for clinical trial to detect drug efficacy. The assay individuals for clinical trial to detect drug efficacy. The assay individuals for clinical trial to detect drug efficacy. The assay individuals for clinical trial to detect drug efficacy. The assay cancer for any action of the aggressive nature of other cancers can be identified and thus allows significant development in the treatment of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ð
                                                                                                                                                                                                                                This sequence represents an antisense oligomucleotide sequence which targets a region of the human tumour necrosis factor alpha (TNPalpha)

targets a region of the human tumour necrosis factor alpha (TNPalpha)

mucleotide sequence. Trisipha is an important cytokine that plays a role

in host defence. It is produced mainly in macrophages and monocytes in

response to infection, invasion, injury or inflammation. Overexpression

of TNPalpha can result in disease states, particularly in infectious,

inflammatory and autoimmune diseases. The invention relates to antisense

oligonucleotides, such as that represented by the present sequence which

are capable of modulating the TNPalpha gene expression. The

oligonucleotides optionally have a phosphorotholoate backbone, and may

calso optionally contain at least one 2'-O-methoxyethyl modification. The

oligonucleotides are useful for modulating the expression of human

coligonucleotides are useful for modulating a human cell inflammatory

response reducing the blood glucose level in a human and treating a

thuman having a disease or condition associated with TNPalpha. Examples of

diseases associated with TNPalpha include diabetes, inflammatory

diseases associated with TNPalpha include diabetes, inflammatory bowel
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ô

```
The present invention is concerned with a number of secreted proteins and their coding sequences isolated from various human cDNA libraries. The probes shown in the specification (AAA93132-A93156) can be used to obtain the cloned sequences from bacterial cells. The proteins and coding sequences from bacterial cells. The proteins and coding sequences can be used in the isolation of similar genes and proteins, in conditions. It is possible that they may have uses as mutritional supplements, as cytokine or cell proliferation factors, in immune modulation, where they may be used to treat immune and autoimmune diseases, as haematopoiesis regulators (treating myeloid or lymphoid cell deficiencies), in the promotion of tissue growth, they may have chemokine or chemotactic activity, haemostatic or thrombolytic activity, or anti-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                clones. 830 cDNA molecules encoding a human procein have been isolated and nucleotide sequences of 5'- and 3'-ends of the cDNA molecules have been determined. Primers for synthesising the full length cDNA are useful for clarifying the function of the protein encoded by the cDNA. The full length clones were obtained by construction of full length enriched cDNA libraries that were synthesised by the oligo-capping method. The primers enable the production of the full length cDNA easily without any special methods. The present sequence is a primer used to amplify a human cDNA encoded.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      synthesizing full length cDNA clones and their use
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; full length cDNA; cDNA synthesis; oligo-capping; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to primers for synthesising full length cDNA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This invention relates to a method for recording genetic analysis data in relation to specific gene. The method comprises analysing the occurrence of changes in the base sequence of a gene compared to a standard gene sequence, and recording the distinguishing and analytical data about the gene by an optical method. The method is an efficient, automatic and accurate way of processing genetic analysis data without compromising patient privacy, for determining the occurrence of mutations and their relationship to diseases and morbidity, responsiveness to drugs, the occurrence of drug side-effects, and other relationships. The present sequence represents a PCR primer used to amplify the human NAT2 DNA sequence in an example illustrating the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Method for optical recording of genetic analysis data for efficient processing of genetic variations without compromising patient privacy.

first active agent comprising an objective antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 mucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising and/or cantinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, communosuppressive, and cytostatic activity. The composition may have a cuse in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or mallignant cisease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an entinflammatory steroid in a subject, for reducing levels of adenosine or receptor, producing bronchodilation, increasing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or receptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject, st issue, or treating bronchoconstriction, continued in inflammation, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         0;

Treating inflammatory disorders such as inflammatory bowel disease, Crohn's disease or rheumatoid arthritis, in a subject, by administering oligonucleotide which inhibits expression of human tumor necrosis factor
                                                                                                                                                                                                                                                          The invention describes a method of treating an inflammatory disorder in an individual, comprising administering to the individual an oligonucleotide upto 30 nucleotides in length complementary to a nucleic acid molecule encoding human tumor necrosis factor (TNF)-alpha. The method is useful for treating an inflammatory disorder such as inflammatory bowel disease, Crohn's disease, colitis or rheumatoid arthritis, in an individual. The method is also useful for treating diabetes, pancreatitis, multiple sclerosis, atopic dermatitis, asthma, and hepatitis in an individual. This sequence represents an antisense oligonucleotide used to modulate expression of tumour necrosis factor

AAT47816-T47827 are PCR primers used for the isolation of the NF2 (neurofibromatosis type 2) gene from various human tumours. NF2 is an autosomal, dominantly inherited disorder characterised by multiple tumours of the central nervous system, predominantly bilateral vestibular schwannomas (acoustic neuromas) of the eighth cranial nerve. Other symptoms of NF2 include cranial meningiomas, spinal nerve root schwannomas and presential lens opacities. The NF2 gene, mapped to chromosomal region 22q12 between the loci D2251 and D22528, acts a tumour suppressor. The NF2 gene is alternatively spliced resulting in three chromosomal regions encoding three different proteins, merlin isoforms I III, which are likely to have differing functions. Merlin stands for moesin-ezrin-radixin like protein, so called due to substantial homology with these three proteins. The NF2 gene isoforms and proteins encoded by them, are useful in diagnosing NF2 disease. Merlin protein some
                                                                                                                                                                                                                                                                                                                                                                                                                                                   as tumour suppressors and can be used to suppress tumour growth, as can the cDNA sequence in gene therapy applications. Antibodies raised against merlin proteins are useful as tumour targetting agents

Nucleic acid associated with autosomal dwarfism in poultry - localised close to micro-satellite marker LEI146 on chromosome 1, useful e.g. to produce probes to identify homozygous birds for breeding.

Disclosure; Fig 2; 53pp; English

AAV49739-V4976B are PCR primers used in the amplification of microsatellite markers around a novel HWGI-c protein isolated from chicken which is associated with autosomal dwarfism in poultry and can be used to produce probes for detecting alleles of a gene responsible for autosomal dwarfism. The Hmgi-c gene is responsible for the pygmy trait in mice and is also present (although not associated with a dwarf syndrome) in humans, and was identified as a likely candidate for the autosomal dwarfism gene in chickens. Probes or microsatellite markers may thus be

primer for Tumour antigen antibody light chain CDR clone.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes neurofibromatosis type 2 (NF2) transcript isoforms. NF2 polynucleotides can be used for diagnosing NF2 diseases, for inhibiting growth of tumnours associated with NF2 mutations (including expression from cDNA introduced in gene therapy vectors) and to raise antibodies (useful as tumour targeting agents, since specific isoforms are often tumour-specific) and as immunoassay reagents for detecting NF2-expression products. NF2 is a tumour suppressor protein, and so has anticancer activity. The present sequence represents a PCR primer for mouse NF2, from an example of the present invention
select birds which are homozygous/heterozygous for the autosomal
             dwarf allele, since this distinction is not possible phenotypically. Breeding lines consisting of dwarf birds can then be produced by selecting birds homozygous for the dwarf allele, useful in breeding methods involving crossing birds from the breeding line with non-dwarf birds especially to produce broiler birds
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Proteins from neurofibromatosis type 2 transcript isoforms - used for diagnosis or inhibition of tumors, and generation of antibodies.

The invention relates to a method for identifying a binding molecule having selective affinity for a ligand comprising: (a) selectively immobilising a diverse population of binding molecules to a solid support; (b) simultaneously contacting the diverse population immobilised on the solid support whith 2 or more ligands; and (c) determining at least one binding molecule which selectively binds to one or more of the ligands. The method allows for the rapid and efficient methods for the identification of binding molecules which exhibit selective affinity for one or more ligands of interest. They are used particularly for identifying tumourspecific binding polypeptides which can be used as targeting agents for cancer therapy that minimises impact on non-tumour tissues
                                                                                                                                                                                                                                                                                                                                                                                                                              Identifying binding molecules for ligands, particularly tumour antigens -
by selectively immobilising a population of binding molecules to a solid
support and screening for binding to two or more ligands.

This invention relates to a full length provirus genomic DNA sequence AAC66281 of equine infectious anemia virus (EIAV) from the donkey lenkcyte strain. Included in the invention are the gag, pol, env rev, tat, and S2 gene sequences AAC66314 - AAC66319 and their encoded proteins AAB35754 - AAB35759. The invention also relates to PCR primers AAC66282 - AAC66288 which are used to isolate the EIAV DNA sequences. Other primers invention for the isolation and characterisation of the DNA sequences invention for the isolation and characterisation of the DNA sequences preparing gene mutation and deletion vaccines, DNA vaccines and characteristics and in producing an equine infectious anemia virus gene transfer system for gene therapy. The proteins and polymucleotides may also be used in the study of HIV.
   Equine infectious anemia virus; EIAV; donkey leukocyte strain; vaccine; gene therapy; human immunodeficiency virus; HIV; primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human, variant thrombospondin 1, variant thrombospondin 4, SNP,

```

```
The present invention provides a method of diagnosing a vascular disease in an individual, involving determining the sequence at various polymorphic sites within the human thrombospondin 1 and thrombospondin 4 genes. The sequences at a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atherosclerosis, myocandial infarction, coronary heart disease, stroke, peripheral vascular diseases, venous thromboembolism pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also useful in forensics, paternity testing, genetic analysis and phenotype correlations to diseases. The present sequence is an example of one of the human gene SNPS shown in the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         colon cell proliferative disorder; non methylated CpG dinucleotide; cytostatic; cancer; adenoma; carcinoma; cytosine methylation state; ss;

Detecting and differentiating between colon cell proliferative disorders associated with a gene or its regulatory regions comprises contacting a target nucleic acid in a biological sample obtained from the subject with reagent

Claim 15; Page 26; 74pp; English.

The invention relates to a novel method for detecting and differentiating between colon cell proliferative disorders associated with at least one gene or its regulatory regions. The method comprises contacting a target nucleic acid in a biological sample obtained from the subject with at reagents of reagents, where the reagent or series of reagents, where the reagent or series of reagents, where the reagent or series of invention demonstrate cycostatic activity whilst the method may useful for detecting and differentiating between colon cell proliferative disorders, including cancers such as colon adenoma and colon carcinoma. The PNA (peptide nucleic acid) oligomers are useful as probes for determining cycosine methylation state or single nucleotide polymorphisms. The current sequence is that of the PCR primer of the invention which was used to amplify the genomic DNA region.

Identifying binding molecules having selective affinity for ligands for discovering reagents for treating diseases, by contacting solid support

The present invention relates to a method for identifying a binding concleuse having selective affinity for a ligand. The method involves molecule having selective affinity for a ligand. The method involves providing a solid support coated with an anti-immunoglobulin reagent, and a phage expressed antibody library. The invention also discloses a tempor for identifying a natibody having selective affinity for a tumour, and a complementarity determining region (CDR) of an antibody selective for a tumour antigen. The methods of the invention are useful for identifying a binding molecule having selective affinity for a ligand, for the discovery of specific reagents for diagnosis and treatment of human diseases, for identifying binding molecules to, for example tumour cells or other cellular pathologies for the selective cargeting of therapeutic agents such as imaging reagents. The methods are concusted and efficient for the identification of binding concupied and efficient for the identification of binding molecules which exhibit selective affinity for one or more ligands of interest. The exhibit selective affinity for one or more ligands of interest. The exhibit selective affinity for one or more ligands of interest. The exhibit multiple ligands of interest. Moreover, very little information is required regarding the identity or function of either the binding conclusing and every and regarding the identity or function of either the binding molecules or methods are malecule or the ligands of interest. Moreover, very little information of molecule or the ligands of interest. Moreover, very little information of molecule or the ligands we are area of the molecule or the ligands of interest and a molecule or molecules areas and a molecule or the ligands of interest and a molecules can be simultaneously screened against diverse populations of coated with anti-immunoglobulin reagent to a phage expressed antibody ligands to rapidly identify numerous molecules exhibiting a desired binding specificity. The methods provide improved sensitivity and specificity of detection through the selective immobilisation of the binding molecule population on a solid support. The present sequence represents a sequencing primer used in the examples of the present Page 14; 26pp; English. Example 5; invention library  $\mathbb{F}$   $\mathbb{F}$

Sequences AAH84132-AAH84370 represent human nucleic acid sequences which protect against cell death (i.e., apoptosis or necrosis). Sequences which protect against cell death (i.e., apoptosis or necrosis). Sequences AAH84132, AAH84145, AAH84150, AAH84120, AAH84120, AAH84120, AAH84120, AAH84120, AAH84120, AAH84120, AAH84120, AAH84120, AAH84135 and AAH84367 represent 10 full-length CDNA clones, while the remaining nucleic acid sequences within the range given above represent the open reading frames (ORFS) of these CDNA clones. Sequences AG498610-AAG98829 represent the polypeptides encoded by the cell death protective or notective or reverse progression through the apoptotic or necrotic prevent, delay or reverse progression through the apoptotic or necrotic pathways when injected into a cell predisposed to or undergoing cell death, and to screen for compounds which modulate their activity or capterssion. Such modulators, preferably a small organic molecule, an antisense molecule, can also be used to treat cell death-related diseases. Such diseases include those associated with cell death-related diseases. Such diseases include those associated with cell death-related diseases. Such diseases include those associated with also includes neurodegenerative disorders used to treat infections with a service as disease. The modulators may also be used to treat infections such as meningitis, malaria, or trypanosomiasis; vascular diseases such as meningitis, malaria, or trypanosomiasis; vascular diseases such as meningitis, malaria, or trypanosomiasis; repitators) myocardial infarction; such as encers or benign tumours; blood cell conditions such as astemme or chronic obstructive pulmonary disease; neoplastic conditions such as astemme or chronic obstructive pulmonary disease; or algence such as astemme or chronic obstructive mended as disease or Habsilmoto's this is skin conditions such as astemme and a disease or Habsilmoto's this is skin or conditions such as astemme and a disease or Habsilmoto's this is skin and or intri conditions such as dermatitis or urticaria; or immune system disorders such as acquired immunodeficiency syndrome (AIDS). The nucleic acids may additionally be used to generate animal models of cell death-associated disorders. The present sequence represents a cell death protective ORF Sequence 18 BP; 4 A; 0 C; 7 G; 7 T; 0 U; 0 Other; Claim 2; Fig 11D; 325pp; English.

AAT80030-T80035 represent amplification primers for the alphal integrin

coding sequence. The primers represented in AAT80036-T80041 are used for

the amplification of the alpha2 integrin coding sequence. These sequences

can be used in the method of the invention. The method of the invention

is for the identification of a mammal having, or at risk of developing,

can perman and known to contain cells expressing integrin RNA or protein for

integrin subunit expression. The integrin subunit expression in the

can perman and the compared with a control tissue sample, where altered

integrin subunit expression is correlated with glomerulopathy. The method

can be modified to identify a mammal with diabetes who has, or is at risk

of developing, secondary pathological changes associated with diabetes.

An increase in alpha2, 3,5 or beta-1 integrin expression and/or a decrease

in alpha1 expression is diagnostic of increased risk of nephropathy. The

methods can be used to determine if patients are likely to develop severe

construction and to monitor progress of disease during treatment protocols Detection of nephropathy in mammals - by comparing integrin subunit expression in a tissue sample compared to a control tissue sample.                                                                                                                                                                       This invention describes the construction of libraries of antibody variable domains containing modified complementarity determining regions (CDRs) carrying a cysteine nose and which have cytokine agonist and antagonist mechanisms of action. The method of the invention can be used to obtain peptide ligand minetics capable of binding a target antigen. The binding members may also be used to provide agonists or antagonists of targets such as cytokines. In particular specific binding members for MIP-1 alpha receptors are useful for treatment of HIV infection and for in vitro investigation of mechanisms of HIV infection. A selection of means to select a different and potentially more effective population of peptide ligands than direct display of similar cysteine noses ligands on the surface of bacteriophage. The products of the invention have anti-HIV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Cysteine noose; antibody variable domain; CDR; cytokine; agonist; complementarity determining region; antagonist; mimetic; antigen; primer; MIP-1 alpha receptor; treatment; HIV infection; CDR3; anti-HIV; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  (CDRs) carrying a cysteine noose and which have cytokine agonist and antagonist mechanisms of action. The method of the invention can be used to obtain peptide ligand mimetics capable of binding a target antigen. The binding members may also be used to provide agonists or antagonists of targets such as cytokines. In particular specific binding members for MIP-1 alpha receptors are useful for treatment of HIV infection and for in vitro investigation of mechanisms of HIV infection. A selection of peptide ligand mimetics from CDR3 vysteine noose libraries provide a means to select a different and potentially more effective population of peptide ligands than direct display of similar cysteine noose ligands on the surface of bacteriophage. The products of the invention have anti-HIV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This invention describes the construction of libraries of antibody variable domains containing modified complementarity determining regions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          0; Gaps

Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense constructs, which down regulate expression of a CD20 gene or neurite growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and central nervous system injury. Nucleic acid molecules,

Claim 88; Page 66; 200pp; English.

The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down regulates expression of a neurite growth inhibitor gene (ND20). The nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a nucleic acids may be enzymatic nucleic acid cleaving an RNA molecule possessing an NCH motif), a G-cleaver (cleaving RNA with a NNA motif) a zinzyme (cleaving RNA with a NNA motif) is used to cleave RNA oc CC with a YGY motif). The CD20-targetting nucleic acid is used to cleave RNA of CC CD20 in the presence of a divalent cation that is preferably MG²+. Curthermore, it may be contacted with a cell to reduce CD20 activity of the cell and treat a patient having a condition associated with the level CC c CD20. The treatment may further comprise the use of one or more treat lymphona, leukeenia, a B-cell lymphona, low-grade or follicular non-Hodgkin's lymphona (NHL), bulky low-grade or follicular non-Hodgkin's lymphona (NHL), bulky low-grade or follicular non-Hodgkin's lymphona (ML), immunocytona (IMC), small B-cell lymphocytic lymphona (Largetting nucleic acid is used to cleave RNA of the NOSO gene in the Immunocytona (IMC), small B-cell lymphocytic lymphona (ML), immunocytona (IMC), small B-cell lymphocytic lymphona (ML), immunocytona (IMC), small B-cell lymphocytic lymphona (MCC). Immunocytona (IMC), small B-cell lymphocytic lymphona (MCC) and divalent cation that is preferably MG²+. Furthermore, the nucleic acid may be contacted with a cell to reduce NOGO activity of the NOGO. The treatment may further comprise the use of one or more content contral nervous system (CNS) injury and cerebrovascular accident (CNA, stroke), Alzheimer's disease, dementia, multiple sclerosis (MS), chemotherapy-induced neuropathy, amyotrophic lateral sclerosis (MS), demontaria nervous system (CNS) injury and cerebrovascular accident chemotherapy-induced neuropathy, amyotrophic lateral sclerosis (MS), disease, mescular espent contaction of the modulation of sisease, c

Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense constructs, which down regulate expression of a CD20 gene or neurite growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and central nervous system injury.

Claim 88; Page 78; 200pp; English.

The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down contests and a color of a neurite growth inhibitor gene (NOGO). The nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a nucleic acids may be enzymatic nucleic acid cleaving an RNA molecule opssessing an NCH motif, a G-cleaver (cleaving RNA with a NGN triplet), a zinbozyme or an amberzyme (cleaving RNA with an NGN triplet), a zinbozyme or an amberzyme (cleaving RNA with an NGN triplet), a zinbozyme or contested contested with a cell to reduce CD20 eave RNA contested with a cell to reduce CD20 eave RNA contested with a cell to reduce CD20 eactivity of the cell and treat a patient having a condition associated with the level contested with a cell to reduce CD20 eactivity of the cell and treatment may further comprise the use of one or more charapies. In particular, the CD20 targetting nucleic acid may be used to treat lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular non-tedgetting nucleic acid is used to cleave RNA contested NHL), immunocytoma (IMC), small B-cell lymphocytic lymphoma, leukaemia, and inflammatory arthropathy. The NOGO-targetting nucleic acid is used to cleave RNA of the NOGO activity of the presence of a divalent cation that is preferably Mg^22+. Furthermore, the contested with a cell to reduce NOGO activity of the contested with a cell to reduce NOGO activity of the cell and treat a patient having a condition associated with the level of NOGO. The treatment may further comprise the use of one or more cell and treat a patient having a condition associated with the level of NOGO. The treatment may further comprise the use of one or more cell and treat a patient having a condition associated with the level of the NOGO. The treatment may further comprise the use of one or more cell and treat a patient having a condition associated with the level of the contested with a cell to reduce or more cell and treat a patient having a condition accoun (CVA, stroke), Alzheimer's disease, dementia, miltiple sclerosis (MS), chemotherapy-induced neuropathy, amyotrophic lateral sclerosis (ALS), Parkinson's disease, ataxia, Huntington's disease, creutzfeld-Jakob disease, muscular dystrophy, and/or other neurodegenerative disease states which respond to the modulation of NOGO expression. The present sequence is an inozyme of the invention

```
The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down regulates expression of a neurite growth inhibitor gene (NGGO). The regulates expression of a neurite growth inhibitor gene (NGGO). The nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a DNAzyme) an Inozyme (an endolytic nucleic acid cleaving an RNA molecule possessing an NCH motif), a G-cleaver (cleaving RNA with a NYN motif) proposessing an NCH motif). The CD20-targetting nucleic acid is used to cleave RNA with a YGY motif). The CD20-targetting nucleic acid is used to cleave RNA with a YGY motif). The CD20-targetting nucleic acid is used to cleave RNA with a YGY motif) and presence of a divalent cation that is preferably MG^2+.

The CD20 in the presence of a divalent cation that is preferably MG^2+.

The cell and treat a patient having a condition associated with the level of CD20. The treatment may further comprise the use of one or more therepies. In particular, the CD20 targetting nucleic acid may be used to treat lymphoma, leukremia, B-cell lymphoma, low-grade or follicular nontreatment, slymphoma (NHL), bulky low-grade or follicular NHL, lymphocytic leukaemia, HIV (human immunodeficiency virus) associated NHL, mantle-cell

lymphoma (MCL), immunocytoma (IMC), small B-cell lymphocytic lymphoma, cimmune thrombocytopaenia, and inflammatory archropathy. The NOGO-crargetting nucleic acid is used to cleave RNA of the NOGO gene in the presence of a divalent cation that is preferably MG'2+. Furthermore, the nucleic acid may be contacted with a cell to reduce NOGO activity of the coll and treat a patient having a condition associated with the level of NOGO. The treatment may further comprise the use of one or more therapies. In particular, the NOGO-targetting nucleic acid may be used to treat central nervous system (CNS) injury and cerebrovascular accident CC, stroke), Alzheimer's disease, dementia, multiple sclerosis (MS), chemotherapy-induced neuropathy, amyotrophic lateral sclerosis (MS), chemotherapy-induced neuropathy, amyotrophic lateral sclerosis (MS), chemotherapy-induced neuropathy, and/or cher neurodegenerative disease constant dystrophy, and/or chher neurodegenerative disease constant sclerosis (MS), chemother swhich respond to the modulation of NOGO expression. The present constant in inozyme of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 A novel method has been developed for identifying an unknown allele of a polyallelic gene. The method involves: (a) contacting the unknown allele with a panel of probes, each of which recognises a sequence motif that is present in some alleles of the polyallelic gene but not in others; (b) observing which probes recognise the unknown allele so as to obtain a fingerprint of the unknown allele; and (c) comparing the fingerprint with fingerprints of known alleles. The present sequence represents a specifically claimed probe for use in the method where the polyallelic

```
gene is a human leukocyte antigen class I gene. The method can be used for genes such as mammalian MHC genes, specifically the HLA class I and I genes, the T cell receptor genes in mammals, TAP, LMP, ras, nonclassical HLA class I genes, human complement factor genes C4 and C2, Bf in the HLA complex, and genes located in mitochondrial DNA, bacterial chromosomes and viral DNA. The method is particularly useful for matching the alleles of the HLA genes in a prospective donor and a prospective recipient in tissue or organ transplantations. The method can also be used in paternity testing, in forensic medicine, as a follow up technique in treatment of haematological malignancies or inherited disorders, in adoptive immunotherapy, and in identification of bacteria and viruses. The method can provide for the identification of alleles of the polyallelic genes using a limited number of selected recurring motif

Novel antisense compounds useful for inhibiting the expression of human 3 phosphoinositide dependent protein kinase-1, useful e.g. for treating inflammation, tumors and infections. Claim 3; Col 39; 41pp; English.

The present sequence is one of a large number of antisense oligonucleotides which are targeted to a nucleic acid molecule encoding human 3-phosphoinositide dependent protein kinase-1 (PDK-1). The antisense compounds may be oligodeoxynucleotides or chimeric oligonucleotides containing a central gap region, consisting of ten 2'-deoxynucleotides, which is flanked on both sides by 2'-methoxyethyl (2'-MOE) wings. The oligonucleotides have a phosphorothicate backbone. The antisense oligonucleotides have a phosphorothicate backbone. The antisense oligonucleotides are useful for inhibiting the expression of human PDK-1 in human cells or tissues. They are also useful for preventing or delaying infection, inflammation or tumours and are useful

related sequences and their complements; and as primers for the amplification of haematopoietic cell proliferation disorder related DNA sequences. The nucleotide sequences from the present invention can also be used for detecting a predisposition to, differentiation between subclasses, diagnosis, prognosis, treatment and/or monitoring of haematopoietic cell proliferative disorders. The present method enables a Detecting and differentiating between hematopoietic cell proliferative disorders, comprises contacting a target nucleic acid with a reagent that distinguishes between methylated and non-methylated CpG dinucleotides. dinucleotides within the target nucleic acid. ABZ09861 to ABZ11118
represent specifically claimed nucleotide sequences from the present
invention. Oligonucleotides from the present invention can be used: for
differentiating between healthy haematopoietic cells and proliferative
disorder haematopoietic cells, for differentiating between acute
lymphocytic leukaemia and acute myelogenous leukaemia, as probes for
determining the cytosine methylation state and/or single nucleotide
polymorphisms (SNPS) of haematopoietic cell proliferation disorder The present invention describes a method for detecting and differentiating between haematopoietic cell proliferative disorders associated with at least 1 gene and/or their regulatory regions in a subject. The method comprises contacting a target nucleic acid in a biological sample obtained from the subject with at least 1 reagent, which distinguishes between methylated and non-methylated Cpg Claim 15; Page 69; 117pp; English.

The method involves selecting ascquence at single genetic locus in targetted cell population that is absent from equivalent locus in non-targetted cell population, obtaining nati-sense RNA having sequence homology with the genetic locus, and permitting anti-sense RNA to hybridise with the RNA transcribed from the genetic locus to form contiguous daRNA for activating PKR. The method is also used for treating proliferative disorders such as neoplastic disease, psoriasis and vasculogenesis or angiogenesis. The present sequence is a PCR primer which is used in targetted cell killing in

```
The sequence represents primer PtrcR, based on the sequence of plasmid plrc99A. The invention relates to a mutant D-amino acid aminotransferase. The mutant protein is useful for production of the D-amino acid preferably glutaryl-7-aminocephalosporanic acid (GL-7ACA) from Cephalosporin C. The D-amino acids are useful in industrial or pharmaceutical products such as sweeteners, antibiotics, peptide enzymes and peptide hormones, and GL-7CA is especially a highly valuable
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  short interfering nucleic acid; siNA; protein kinase C alpha; PKC-alpha; RNA interference; cycostatic; vasotropic; nephrotropic; modulation; inhibition; cancer; breast cancer; ovarian cancer; lung cancer; prostate cancer; glioblastoma; proliferative disease; restenosis;
                                                                                                                                                                                                                                                                                                                                                                                                                              Mutant D-amino acid aminotransferase useful for production of D-amino acid e.g. glutaryl-7-aminocephalosporanic acid from Cephalosporin C, has a substitution at position 13 of wild-type enzyme from bacillus.

The present invention describes a short interfering nucleic acid (siNA)
that downregulates expression of a protein kinase C-alpha (PKC-alpha)
gene by RNA interference. Also described: (1) a siNA that modulates
cypression and/or activity of genes for other isoforms of PKC or genes
involved in the PKC pathway; (2) kits for in vitro or in vivo delivery of
siNA; (3) conjugates and/or complexes of siNA; and (4) vectors that
express siNA. The siNA sequences have exptstatic, vasotropic and
nephrotropic activities, and can be used in the modulation (inhibition)
certain activities, and can be used in the modulation (inhibition)
of expression of the PKC-alpha genes They are potentially
used to modulate expression of PKC-alpha genes. They are potentially
useful in treating a variety of cancers including e.g. breast cancer,
used to modulate expression of FKC-alpha genes. They are profiterative diseases
cancers of the head and neck, ovarian cancer, lung cancer, prostate
cancer, and glioblastoma and for treating other proliferative diseases
and conditions, such as restenosis and polycystic kidney disease. The
siNA may also be useful for diagnosis, drug screening, target
cidentification and validation, genetic engineering, studying gene
function, and for gene mapping (e.g. of single-nucleotide polymorphisms).
The present sequence represents a human PKC-alpha siNA, which is used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ·

The present invention describes a short interfering nucleic acid (siNA) that downregulates expression of a protein kinase C-alpha (PKC-alpha) gene by RNA interference. Also described: (1) a siNA that modulates expression and/or activity of genes for other isoforms of PKC or genes involved in the PKC pathway; (2) kits for in vitro or in vivo delivery of siNA; (3) conjugates and/or complexes of siNA; and (4) vectors that express siNA. The siNA sequences have cytostatic, vasotropic and nephrotropic activities, and can be used in the modulation (inhibition) of expression of FKC-alpha gene by RNA interference. The siNA can be useful in treating a variety of cancers including e.g. breast cancer, useful in treating a variety of cancers including e.g. breast cancer, cancers of the head and neck, ovarian cancer, lung cancer, prostate cancer, and glioblastoma and for treating other proliferative diseases and conditions, such as restenosis and polycystic kidney disease. The cancer be useful for diagnosis, drug screening, target cancer indentification and validation, genetic engineering, studying gene function, and for gene mapping (e.g. of single-nucleotide polymorphisms).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ô

A sample of 371 DNA sequence fragments were determined and of these, 277 were suitable for STS primer prediction by computer analysis (using the "Primer" program available from E.Lander, MIT). The STSs and cosmids were mapped by in situ hybridiation, somatic cell hybrid analysis or both. Using this method, 370 STSs specific for human chromosome 11 were generated and most of them were regionally mapped. This procedure illustrates a novel method for sequencing complex genomes, designated "sequence sampled mapping". The sequence sampled mapping method is useful for the completion of high density sequence-based maps, and ultimately, for the complete sequencing of genomic DNA directly from cosmid clones. See MAQ82001-Q82706 for STS primers. (Also see AAQ91325-58). (Updated on 25-MAR-2003 to correct PN field.)

The oligonucleotides which specifically hybridise to B7 modulate its expression (and thus T cell activation and proliferation). This is particularly useful for treatment and prevention of inflammation and autoimmune diseases, e.g. asthma, (juvenile) diabetes, myasthenia gravis, Grave's disease, rheumatoid arthritis, allograft rejection, psoriasis, (systemic) lupus erythematosus, multiple sclerosis, contact dermatitis, rhinitis, allergy, cancer and metastases. The oligonucleotides may also be used to manipulate T cell activation ex vivo; to determine or detect B7 protein expression; for diagnosis; as assay and purification reagents, and to study physiological roles of B7 proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human leukocyte antigen; HLA; class I allele type; probe; PCR primer;
amplification; hybridisation; organ transplant; gene typing; diagnosis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New oligo:nucleotide(s) that modulate expression of B7 proteins - used for, e.g. controlling activation and proliferation of T cells, particularly for treatment, diagnosis and prevention of inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

leukocyte antigen (HLA) class I antigen or allele by a combination of polymerase chain reaction (PCR) using a primer pair whereby all HLA-A, -B or -C alleles can be amplified or using reverse hybridisation analysis or—comprising a DNA probe covalently bonded to microtitre plate wells which specific HLA-A, -B or—c allele. The method is applicable in gene typing, judging donor-recipient compatibility during organ transplant and correlation analysis for diagnosis of various diseases. The method is applicable in gene typing, simple, rapid and accurate, with possibility of mechanisation and automation, without the problems encountered by using the prior-art techniques. AAA66941 to AAA67072 represent invention
                                                                                  type with possibility of mechanization and automation, applicable in judging donor-recipient compatibility during organ transplant and disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel compound for diagnosing, preventing and treating immune disorders, comprising an oligonucleotide that specifically hybridizes with a nucleic acid sequence encoding B7 protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention provides sequences of antisense oligonucleotides targeted at the murine and human B7-1 and B7-2 coding and mRNA sequences.
                                                                    Simple, rapid and accurate method for distinguishing HLA class I allele
                                                                                                                                                                                      The present invention describes a method for distinguishing a human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; mouse; B7-1; B7-2; antisense; PCR primer; inflammation; autoimmune disorder; phosphorothioate backbone; ss.

The antisense sequences have phosphorothhoate backbones and be used in uncleotides are 2'-methoxyethoxy residues. The sequences can be used in the treatment of inflammatory and autoimmune disorders, including asthma, juvenile diabetes mellitus, myasthenia gravis, Graves' disease, rheumatoid arthritis, allograft rejection, inflammatory bowel disease, multiple sclerosis, psoriasis, systemic lupus erythematosus, contact dermatitis, rhinitis, allergies and cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention provides a microarray of oligonucleotides comprising probes for the human HLA Class I genes attached to a solid support. These can be used in HLA typing. Oligonucleotide arrays are also useful in large scale gene discovery, monitoring gene expression, polymorphism detection and gene mapping
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Oligonucleotide arrays useful for human leukocyte antigen (HLA) tissue typing, comprises HLA class I oligonucleotide probes representing all known polymorphisms in HLA class I locus, on a solid support.
                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

AB221947 to AB221958 represents death inhibiting factor tumour related gene (AP14, also known as fade-inhibition factor) antisense oligonucleotides. The present invention also describe a human liver cancer (HepG2) cell strain and Balb/c (nu/nu) nude mouse inoculative liver cancer cells which can be used as models for screening and evaluation of the 12 antisense oligonucleotides. In vitro studies show that the antisense oligonucleotides can effectively inhibit the growth of human liver cancer cells, and have a dose-dependent relationship. In the nothing mouse model the antisense oligonucleotide also inhibits growth of tumours. Therefore, the antisense oligonucleotide also inhibits growth of tumours flatense tumours and its tumour related diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Antisense oligonucleotide which specifically hybridizes with a region of a nucleic acid encoding human Damage-specific DNA binding protein p48, useful for treating diseases and conditions associated with p48
                                                                                                                                                                                                                                                                                                         Antisense oligonucleotide structure and use using fade-inhibition factor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; ss; antisense oligonucleotide; antisense therapy; PCR; primer; damage specific DNA binding protein 2; DDB2; p48; chromosome 11; DDB; E2F transcription factor; p48 expression-related disease; DDB2 expression-related disease;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention provides a microarray of oligonuclectides comprising probes for the human HLA Class I genes attached to a solid support. These can be used in HLA typing. Oligonuclectide arrays are also useful in large scale gene discovery, monitoring gene expression,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; death inhibiting tumour related gene; API4; liver; HepG2; antisense oligonucleotide; fade-inhibition factor; liver cancer; tumour; tumour related disease; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Oligonucleotide arrays useful for human leukocyte antigen (HLA) tissue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               typing, comprises HLA class I oligonuclectide probes representing all known polymorphisms in HLA class I locus, on a solid support.

The invention comprises antisense oligonucleotides targeted to the human damage specific DNA binding protein 2 (DDB2 - also known as p48) gene, located on chromsome 11. DDB2 is a subunit of the the DDB protein which is believed to be a negative regulator of the BZF transcription factor. The antisense oligonucleotides of the invention are used to treat a person suspected of having or being prone to a disease or condition associated with DDB2/p48 expression. The present DNA sequence represents a human DDB2/p48 antisense oligonucleotide of the invention. NOTE: The present DNA sequence is a 2'-0-methoxyethyl gapmer and contains a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Antisense compound; caspase 9; C9; hyperproliferative disorder; stroke; hemactopoidetic disorder; cholesterol disorder; bone metabolism disorder; brain injury; neurodegenerative disease; infection; inflammation; tumour; phosphorothioate backbone linkage; 2'-methoxyethyl; 2'-MOE; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Chimeric phosphorothioate oligonucleotide #90 for caspase 9 inhibition.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        /mod_base= OTHER

·. nucleic acid molecule encoding caspase 9 (C9). The compound specifically hybridises with and inhibits the expression of caspase 9. The invention also describes an antisense compound that specifically hybridises with an also describes an antisense compound that specifically hybridises with an subjective street of the nucleic acid. The invention is useful for inhibiting the expression of C9 in cells or tissues and is also useful for treating an animal having a disease or condition associated with C9, including an hyperproliferative, haematopoietic or cholesterol disorder, home metabolism disorder, stroke, brain injury or neurodegenerative disease. The compound is commonly useful as a research and diagnostics reagent. It is also useful to distinguish between functions of various members of a biological pathway. The invention also be useful prophylactically e.g. to prevent or delay infection, inflammation or tumour formation. The antisense compound of the invention is often preferred over native form because of enhanced cellular uptake, enhanced affinity for nucleic acid target and increased stability in presence of nucleases. The present nucleic acid sequence represents one of a collection (ABKS9249-ABK69396) of chimeric phosphorothicate oligonuclectides having 2'-methoxyethyl (2'-MOB) wings. This sequence was Human; antisense; lung dysfunction, nasal airway dysfunction; antiinflammatory steroid; ubiquinone; antiinflammatory; antiallergic; antiasthmatic; hypotensive; immunosuppressive; cytostatic; gene therapy; antisense gene therapy; respiratory; lung; adenosine sensitivity; adenosine receptor; bronchodilation; bronchoconstriction; lung allergy; lung inflammation; respiratory disease; ds. The present invention relates to a new antisense compound targeted to a New antisense oligonucleotide which modulates expression of caspase 9, useful to treat tumor, inflammation or to prevent infection in humans. respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or

Disclosure; SEQ ID NO 13028; 872pp; English.

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, 5' or 2' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a cuse in antisense gene therapy. The composition is useful for treating or preventing a respiratory lung or therapeutic respiratory effect of an autisinflammatory steroid in a subject, for reducing or depleting levels of or reducing bencholdiation, increasing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung suffacemation, lung allergies, or a respiratory disease or condition. lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published pct sequences

Crooke RM,

New antisense oligonucleotides, useful for modulating the expression of C-reactive protein or for treating a disease or condition associated with the expression of C-reactive protein, e.g. unstable angina or myocardial infarction

```
The present invention describes a rat highly sensitive to carcinogen with its normal function of gap junction inhibited. Also described: (1) constructing the transgenic rate by obtaining a plasmid vector through integration of a mutated rat connexin cDNA to the downstream of a promoter, followed by microinjection of such plasmid vector into a fertilised egg and transplantation to the oviduct; (2) detecting carcinogens by administering a test substance into the rat that is highly sensitive to carcinogen to induce cancer onset.

The rats are applicable in detecting carcinogen to induce cancer onset.

The rats are applicable in detecting carcinogens and screening anticancer drugs. With this method, carcinogens can be detected quickly and highly sensitively. These animals can be used for efficient screening of cancinoment and incomes and screening of cancinoment and any anticancer drugs. The present sequence represents a mutagenic PCR primer for rat gap junction membrane channel protein beta 1 (Gjbl), which is used in an example from the present invention. Rat Gjbl; which is
                                                                                                                                                                                                                                                                           ·

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ..
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention describes a method and a kit for determining the expression of mRNA or CDNA of a protein participating in the maintenance of skin structure. The method is quantitative, simple and accurate in the determination of extracellular matrix components of laminin 5 chain genes IMAMA3, LAMB3 and LAMC2, matrix metalloproteinases MMP-1, MMP-2, MMP-3 and MMP-9, VII collagen, type I collagen alpha 1 chain, type IV collagen alpha 2 chain, type IV collagen alpha 2 chain, TIMP-1, TIMP-2 and TIMP-3.                                                                                                                                                                                                        The DNA encodes a fragment of a novel calcitonin precursor. The calcitonin precursor may be prepared by ligating a number of synthetic oligonuclectides, each comprising part of the DNA sequence encoding the calcitonin precursor, and transforming a microbial cell with a plasmid containing this DNA construct. The recombinant calcitonin precursor protein may then be collected from the culture media. The calcitonin precursor has both promoting activity on bone formation and inhibits bone absorption. See also AAQ51158-86
                                                                                                                                             in precursor comprising peptide with (repeat units of) specified - promote bone formation and inhibit bone resorption.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New nucleic acid segments containing polymorphic sites, or complements and methods of detecting a nucleic acid - for general use including diagnosis and monitoring of diseases.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       contain single nuclectide polymorphisms (SNPS). A method is included in the invention for analysing a nucleic acid sample, which consists of determining the base occupying any one of the polymorphic sites given in the SNP containing dequences. The nuclectide sequences can be used in the diagnosis or monitoring of diseases, such as cancer, inflammation, heart diseases, diseases of the cardiovascular system, and infection by microorganisms. The oligonucleotides are also useful in the manufacture of a medicament for the treatment or prophylaxis of the diseases, and as a pharmaceutical. SNP containing oligonucleotides are useful in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       DNA sequences AAH62100 - AAH62688 represent segments of human genes which
New nucleic acid segment comprising one of the 10 - 100 bp sequences given in the specification (sequences of a polymorphic site), or the complement of the segment and a method of analysing a nucleic acid comprising determining the base occupying the polymorphic site of the polymorphic fragment sequences are disclosed in the specification. The information obtained from nucleic acid analysis by the method described is useful in diagnosis or monitoring of diseases like cancer, inflammation, heart disease, CNS diseases, and susceptibility to infection by microorganisms. In addition, the nucleic acid segments are useful in manufacturing medication in the treatment of prophylaxis of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New nucleic acid segments of the human genome, particularly from genes including polymorphic sites, for phenotype correlation, forensics, paternity testing, medicine and genetic analysis.
                                                                                                                                                                                                                                                                                                                            Gaps

Also described: (1) constructing the transgenic rats by obtaining a plasmid vector through integration of a mutated rat connexin cDNA to the downstream of a promoter, followed by microinjection of such plasmid vector into a fertilised egg and transplantation to the oviduct; (2) detecting carcinogens by administering a test substance into the rat, and (3) screening anticancer substances by administering a test substance into the rat that is highly sensitive to carcinogens to induce cancer onset. The rats are applicable in detecting carcinogens and screening anticancer sensitively. These animals can be used for efficient screening of anticancer drugs. With this method, carcinogens can be detected quickly and highly sensitively. These animals can be used for efficient screening of anticancer drugs. Mith this method to be used for efficient screening of anticancer drugs. The present sequence represents an oligonucleotide
applications such as phenotype correlation, forensics, paternity testing, medicine and genetic analysis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Highly carcinogen-sensitive transgenic rats with partial deletion of connexin gene to inhibit normal function of gap junction, applicable in detecting carcinogens and screening anticancer drugs.

The present sequence is a forward PCR primer for the uidh (GUS) gene. Use with the reverse primer given in ACC84121 amplifies a 1.27 kb fragment within the uidh gene coding region. The invention discloses a method of transforming intact plants, allowing transformation e.g. of elite germplasm. Seedlings are directly incollated with a virulent strain of Agrobacterium tumefaciens, subjected to selection, and then generated directly into plants. The process is genotype-independent and rapid, since tissues do not pass through a dedifferentiation step to callus, and plant regeneration is not dependent on shoot organogenesis or somatic mbryogenesis. Somaclonal variation is reduced. The method can be used with a gymnosperm (conifer, especially pine), or an angiosperm (monocot or dicot). Transformation of pine (Pinus taeda L.) was used as an example of the method. An A. tumefaciens strain harbouring super-virulent pribo542 was used to incoulate intact germinated pine seedlings. PCR was used to screen for Agrobacterium contamination and for transferred genes, such as uidh, in the regenerated plants
                                                                                                                                                                                                                                                                                                                                                                                                                                                     Transforming intact plant tissue by germinating an intact plant seeding having a shoot apex and directly inoculating the shoot apex of the germinated intact plant seedling with Agrobacterium tumefaciens to

/*tag= a //note= "at least one (and preferably all) of the backbone subunits are composed of amide units, so that the oligomer consists of the nucleobases attached covalently to a polyamide backbone"
                                                                                                                                                                                                                                                                                                                                                           Antisense oligonucleotides which target human VCAM-1 were synthesised the phosphorothicate form. The oligonucleotides are useful to treat diseases which are modulated by changes in intercellular adhesion molecules. This sequence corresponds to nucleotides 2038-2057 of the coding region of human VCAM-1. (Updated on 25-MAR-2003 to correct PN
                                                                                                                                                                                                                                                                      Oligo:nucleotide modulation of cell adhesion - used in the treatment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          peptide nucleic acid; PNA; intercellular adhesion molecule; ICAM-1; endothelial leukocyte; BLAM-1; vascular; VCAM-1; antiinflammatory; anticancer; antimetastatic; anti-AIDS; anti-rhinoviral; ss.
                                                                                                                                                                                                                                                                                         e.g. psoriasis, inflammatory bowel disease or malignant melanoma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Peptide nucleic acid oligomer targetting VCAM-1 coding region.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Primers corresp. to DNA coding for part of the beta-chain of the T cell antigen receptor (pref. the Variable region primers AAQ50905- AAQ50926) are used in PCR to amplify the T cell antigen receptor gene. The amplified gene is detected by the single-strand conformation polymorphism method using hybridisation probes corresp. to the beta-chain J domain (see AAQ50928-Q50940). (Updated on 25-MAR-2003 to correct PN field.)

New peptide nucleic acid oligomers hybridising to adhesion molecule genes - are stable anti:sense cpds. of high affinity, partic. for treating inflammation, viral infection, cancer etc.
                                                                                                                                                                                              Claim 18; Page 45; 57pp; English.
```

New oligomers are claimed which (A) have at least one peptide nucleic acid (PAM) subunit and (B) have a sequence hybridisable to AUG region, coding region, 5'-untranslated region of 1'-untranslated region of ICAM-1 or ELAM-1, or hybridisable to AUG region, coding region, 5'-untranslated region of VCAM-1.

Or ELAM-1, or hybridisable to AUG region, coding region of VCAM-1.

The PNAs can be used to target RNA and single stranded DNA (SSDNA) to produce antisense-type gene regulation moieties. Hence they may be used antimetastatic agents to accomplementation moieties, antichancer agents, and as econd PNA strand binds with the resulting double helix or with the first PNA strand. The PNA strand binds with the resulting double helix or with the first PNA strand. The PNA program and are water soluble, which facilitates cellular uptake. Further, since they contain amides of non-biological amino acids, they are biostable and resistant to enzymatic degradation by protenses. The present sequence targets vascular and acids agents agents agents agents agents agents. proteases. The present (VCAM-1) coding region cell adhesion molecule-i

```
Rapid and cost effective diagnosis of disease-associated mutations in the p53 gene is achieved by employing a selected number of diagnostic tools, in a hierarchy of increasing accuracy and cost per tool, in which each tool detects essentially no false positives. Tests that may be employed, in order of increasing accuracy and cost are: (a) immunoassays, (b) DNA fragment length/quantity analysis; and (c) DNA sequencing of regions most likely to harbour point mutations. AATO8645-66 are primers used in DNA fragment length/quantity analysis. The amplification of the eleven exons is advantageously carried out in 3 multiplex positives of a pool selected because they all use the same hybridisation temperature and none of the expected fragment lengths will more in a material and contact the same hybridisation temperature
                                                                                                                                                                                                                                                                                                                                                                                                                          0
                                                                                                                                                                                                                                  and none of the expected fragment lengths will overlap in an electrophoresis gel. One of each pair of primers is labeled at the 5' end with an identifiable marker such as fluorescein, rhodamine or cyanine. The present sequence is used with AAT08662 to amplify a 261 bp fragment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ICAM-1; endothelial leukocyte adhesion molecule-1; ELAM-1; E-selectin; vascular cell adhesion molecule-1; VCAM-1; white blood cell; brequinar; vascular endothelium; allograft rejection; immunosuppression; rapamyoin; anti-1ymphocyte serum; monoclonal antibody; cardiac allograft; therapy; renal allograft rejection; donor-specific transplant tolerance; LFA-1;

The Delta3 gene is involved in the growth and differentiation of cells. Delta3 agonists can be used for promoting the tissue
                  endothelial leukocyte adhesion molecule-1 (ELAM-1, also known as Eselectin), or vascular cell adhesion molecule-1 (VCAM-1). This sequence targets the coding region (nuclectides 2038-2057) of VCAM-1. ICAM-1, ELAM -1, and VCAM-1 represent three of the five cell adhesion molecules involved in the adherence of white blood cells to vascular endothelium. These sequences can be used in a composition for treating allograft
                                                                                                                                     rejection. The composition contains one of these sequences in combination with an immunosuppressive agent. The immunosuppressive agent used in the compositions is brequinar, rapamycin, anti-lymphocyte serum, a monoclonal antibody against LRA-1 or an antisense oligonucleotide. The compositions can be used for treating or preventing allograft rejection, such as cardiac or renal allograft rejection. By using these compositions, allograft survival times are extended, and donor-specific transplant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New isolated human Delta3 gene - used to develop products for treating, e.g. nerve injury, neurodegenerative disorders, peripheral neuropathies and spinocerebella degenerations.
sequences for human intercellular adhesion molecule-1 (ICAM-1),

The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see AAX34584- AAX35879) can be used in immunogenic compositions as vaccines. Vectors containing C. pneumoniae especially where the vector directs the expression of a neutralising epitope of C. pneumoniae
                                                                                                                                                                                                                                            0
regeneration or repair needed to treat a nerve injury, neurodegenerative disease, neurodifferentiative or neurodevelopmental disorders including peripheral neuropathies and spinocrebella degenerations. Delta3 antagonists can be used to treat neoplastic or hyperplastic diseases, e.g. cancers, Waldenstroem's macroglobulemia and fibroproliferative disorders, particularly of cerebravascular tissue. The nucleic acids can also be used for gene therapy. The products can also be used for antibody production, detection, diagnosis and drug screening
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Respiratory disease; pneumonia; bronchitis; heart disease; sarcoidosis; sinusitis; purulent otitis media; erythema nodosum; pharyngitis; vaccine; neutralising epitope; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ..
                                                                                                                                                                                                                                                                                                                                                                                                                                                        AAX91991-X97517 represent PCR primers used to amplify open reading frames and other nucleic acid sequences from the genome of Chlamydia pneumoniae (see AAX91990). C. pneumoniae causes respiratory disease such as pneumonia and bronchitis and is thought to be a contributing factor in heart disease, sarcoidosis, sinusitis, purulent otitis media, erythema nodosum or pharyngitis. The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see AAY34584- AAY35879) can be used
                                                                                                                                                                   Respiratory disease; pneumonia; bronchitis; heart disease; sarcoidosis; sinusitis; purulent otitis media; erythema nodosum; pharyngitis; vaccine; neutralising epitope; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    in immunogenic compositions as vaccines. Vectors containing C. pneumoniae mucleotides sequences can also be used as immunogenic compositions, especially where the vector directs the expression of a neutralising epitope of C. pneumoniae
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ;

The present invention relates to antisense oligonucleotides (see AAA55496 -A55757) which are targeted to nucleic acids encoding a human tumour necrosis factor receptor-associated factor (TRAF). The antisense sequences comprise at least one modified internucleotide linkage, which is a phosphorothicate linkage. The oligonucleotides also include at least one modified sugar moiety such as a 2'0-methoxyethyl sugar moiety. Sequences AAA5490-A55495 represent nucleotide sequences encoding human TRAFI-6. Included in the invention is a method for treating a human administering an antisense oligonucleotide. The reduction of jun kinase activation in cells comprises contacting the cells with an antisense oligonucleotide the reduction of E-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      selectin expression in cells or tissues comprises contacting the cells or tissues with an antisense oligonucleotide targeted to TRAF-2 or TRAF-6. The antisense oligonucleotides have antiproliferative and anti-inflammatory activity and are useful for treating disorders associated with cell proliferation and inflammation. The antisense oligonucleotides may also be used as a diagnostic probe for studying gene function
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Antisense oligonucleotides targeted to nucleic acids encoding human tumor necrosis factor receptor-associated factor (TRAF), useful for treating diseases associated with TRAF expression such as inflammatory diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Hepatitis B virus, HBV; Hepatitis A virus, HAV, probe, detection, mutation, high-density gene chip, ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                   The present invention describes a method which comprises making a high-density gene chip, specifically for making high-density micro-array of oligomucleotide probes. An oligomucleotide probe selecting process to seek preferentially length variable and coverage variable probes is provided to ensure identical cross melting temperature of probes is provided to ensure identical cross melting temperature of probes is relatively simple and raise the cross control of gene chip results. The process proposes a specific probe selection method for detecting target sequence directly, detecting mutation in both specific and non-specific sites and a probe overall arrangement scheme. The primer is based on the GE160 nucleotide sequence. Granulocytic ehrlichia is the causative agent of granulocytic ehrlichiosis, an acute potentially fatal tick-borne infection. A vaccine comprising a GE nucleic acid molecule or the polypeptide that it encodes, is used for producing an immune response in a host to prevent granulocytic ehrlichiosis in an animal. The protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel granulocytic ehrlichia nucleic acid molecules, their polypeptides useful as vaccines for treating ehrlichiosis in mammals e.g. humans, pigs
                                                                                                        seek preferentially length variable and coverage variable probes is provided to ensure identical cross melting temperature of probes to the maximum limit, and this can make the cross control of gene chip relatively simple and raise the relability of the gene chip detecting results. The process proposes a specific probe selection method for and non-specific sequence directly, detecting mutation in both specific and non-specific sites and a probe overall arrangement scheme. AAA9738 to AAA80201 represent oligonucleotide probe sequences which are used in
The present invention describes a method which comprises making a high-density gene chip, specifically for making high-density micro-array of oligonucleotide probes. An oligonucleotide probe selecting process to

New antisense oligonucleotides, used for treating e.g. inflammatory conditions, psoriasis, graft rejection, cancers, infections, cardiovascular disorders or autoimmune disorders.

Example 17; Page 82; 199pp; English

This sequence is an antisense oligonucleotide of the invention. The antisense oligonucleotides are targeted to a nucleic acid encoding a callular adhesion molecule (CAM) and is capable of modulating the expression of the CAM. They particularly inhibit intercellular adhesion molecule-1 (UCAM-1), or molecule-1 (ICAM-1), rotal activation molecule-1 (UCAM-1), or capable adhesion molecule-1 (UCAM-1), or molecule-1 (ICAM-1). The antisense oligonucleotides can be used to modulate CAM activity in mediating cell:cell interactions and subsequent cellular and biological responses, coll:cell interactions and subsequent cellular and biological responses, cell:cell interactions and subsequent cellular and biological responses. They can be used for treating an animal suspected of having or being prone to a disease or condition associated with a CAM. Oligonucleotides condition e.g. inflammatory bowel disease such as Crohn's disease, condition e.g. inflammatory bowel disease such as Crohn's disease, condition e.g. inflammatory bowel disease such as Crohn's disease, condition e.g. inflammatory bowel disease such as Crohn's disease, condition e.g. inflammatory conticion a viral infection. The ICAM-1 sequences can also be used for reducing corticosteroid use in a patient or for reducing cyclosporine use in a patient. The oligonucleotides can also be used for treating e.g. theyperproliferative diseases, tumours, diapedesis, graft versus host

30 nucleobases in length that are capable of inhibiting the expression of phosphoenol pyruvate carboxykinase-cytosolic (PBPCK-cytosolic). The antisense compounds are useful for inhibiting the expression of PEPCK-cytosolic in cells or tissues. They are commonly used as research reagents and in diagnostics, e.g. to elucidate the function of particular genes. They are also useful for distinguishing between functions of various members of a biological pathway and for research use. The

The present sequence is one of a number of antisense compounds of up

Claim 1; Col 43; 64pp; English

antisense compounds are also useful prophylactically, e.g. to prevent or delay infection, inflammation or tumour formation. The present sequence is a chimeric phosphorothioate oligonucleotide with 2'-MOE wings and a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This invention describes a novel alkaline cellulase gene from a Bacillus sp. The alkaline cellulase gene is used for the preparation of an alkaline cellulase useful as a textile detergent and a textile treating agent. This sequence represents a PCR primer used in the amplification of the Bacillus sp. alkaline cellulase described in the method of the

Detecting cancer involving oncogenes, tumour suppressor genes, or genes involved in DNA amplification, replication, recombination or repair, the cancer is specifically associated with a gene selected from BRCAI gene, p53 gene, human papillomavirus types 16 and 18 and liver cancers. The method is also used for environmental monitoring, forensics and the food and feed industry, detecting comprises scanning (using e.g. a scanning electron microscope and infrared microscope) the support at the particular sites and identifying if ligation of the oligomuclectide probe patt occurred and correlating (using a computer) identified ligation to a presence or absence of the target nucleotide sequences.                                                                                                                                                                                                                                                                                                                                                                                                                                          (I) have melting temperatures within a narrow range. The method is useful for detecting infectious diseases caused by bacterial infectious agents e.g. Salmonella, Listeria monocytogenes and Haemophilus influenza, fungal infectious agents e.g. Cryptococcus neoformans, Candida albicans and Aspergillus fumigautus, viruses e.g. T-cell lymphocytotrophis cirus, Epstein-Barr virus and polio virus, and parasitic infectious agents selected from Onchoverva volvulus, Entamoeba histolytica and Dracunculus medinesis. The method is also useful for detecting genetic diseases such as 21 hydroxylase deficiency, Turner Syndrome and obesity defects.
                                                                                                                                           Designing capture oligonucleotide probes for use on a support to which complementary oligonucleotides hybridize with little mismatch.
                                                                                                                                                                                                                                                                                                                                     The present invention describes a method (M1) for designing capture oligonuclectide probes (I) for use on a support to which complementary oligonuclectide probes (II) will hybridise with little mismatch, where
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  0

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the intiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or masal airway dysfunction and a second active agent comprising an antiinflammatory, antiallergic, antiasthmatic, hypotensive, an antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or mallganet disease or condition, also antiinflammatory steroid in a subject, for reducing or depteting levels of for entancing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject, st issue, or treating bronchoonstriction, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO are increased.
                                                                                                                                                                                                                                                                                                                                    Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the institucion codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an entiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antistrangenty steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject, stissue, or treating bronchoconstriction, increasing levels of upiquinone or lung surfactant in a subject of the subject Pharmaceutical composition for treating ailments associated with impaired lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid or Gaps Katz E, Pabalan J, Aguilar D; . 0 4.7%; Score 13.6; DB 1; Length 20; 10.0%; Pred. method is useful forsecond a mechanical formation for an extension for an extension for a method is useful for screening a modulator of GPR86 activity. The method is useful for screening a modulator of GPR86 activity, and for determining if a candidate modulator increases or decreases the activity of GPR86. Identified modulators are useful in the manufacture of a pharmaceutical composition for preventing, treating and/or alleviating diseases or disorders characterised by dysregulation of GPR86 signalling cuch as ostatic hypertrophy, migraine, vomiting, psychotic and neurological disorders, including anxiety, depression, schizophrenia, manic depression, delirium, dementia, severe mental retardation, dependation, caperative diseases, neurodegenerative diseases such as Alzheimer's disease or Parkinson's disease, dyskinesias such as Authington's disease or Gilles de la Tourette's syndrome and other related diseases including thrombosis and other cardiovascular disease, autoimmune and inflammatory diseases, inflections such as bacterial, fungal, protozoan developmental disorders, inflections such as bacterial, fungal, protozoan and viral nfections such as infections caused by HIV-1 and HIV-2, pain, cancer, anorexia, bullanda, asthma, acute heart failure, hypertension, urinary retention, osteoporosis, angina pectoris, myccardial infarction, uncertiant of the invention. The gene for the GPR86 (P2X13) sequence is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Screening for modulator of G protein coupled receptor, GPR86 activity, by incubating cells expressing GPR86 with candidate modulator and detecting signaling activity of the polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

```
The present invention describes a compound (I) comprising 8-50 nucleobases which is targeted to a 5' untranslated region (UTR), coding, 3' UTR or intron region of a nucleic acid molecule encoding phospholipase A2, group IIA (synovial), where the compound specifically hybridises with Also described: (I) a composition comprising the compound and a carrier or diluent; (2) a method of inhibiting the expression of phospholipase A2, group IIA in cells or tissues; and (3) a method of treating an animal aving a disease or condition associated with phospholipase A2, group IIA having a disease or condition associated with phospholipase A2, group IIA antipsoriatic activities, and can be used in vaccines and in gene therapy. The compound (I) can be used for preparing a composition for treating or preventing inflammation, cancer, psoriasis or diabetes. The present sequence represents a human phospholipase A2 group IIA (synovial).
                                 Phospholipase A2 group IIA; synovial; antisense modulation; inflammation; phospholipase A2 group IIA inhibitor; phosphorothicate; antiinflammatory; antidiabetic; cytostatic; antipsoriatic; vaccine; gene therapy; cancer; psoriasis; diabetes; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Phospholipase A2, group IIA, useful for preparing a composition for treating or preventing inflammation, cancer, psoriasis or diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       compound that hybridizes with and inhibits the expression of
 Human phospholipase A2 antisense oligonuclectide SEQ ID NO:22.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 20 BP; 4 A; 7 C; 3 G; 6 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Claim 3; Page 86; 135pp; English.

The invention comprises DNA sequences that show enhanced expression in human neuroblastoma with good prognosis. The DNA sequences of the invention are useful in clarifying good/poor prognosis of neuroblastoma. The present DNA sequence was used in the exemplification of the invention Nucleic acids isolated from neuroblastoma showing enhanced expression in human neuroblastoma with good prognosis, useful in clarifying good/poor prognosis of neuroblastoma and providing genetic data. Example 5; Page 23; 444pp; Japanese WPI; 2003-167523/16.

derived from the fungus Saprolegina diclina that encode omega-3 desaturases (also referred to as delta-17 desaturases) and delta-12 desaturases (also referred to as delta-17 desaturases) and delta-12 useful for preventides, composition and methods of the invention are useful for preventing or treating conditions caused by insufficient intake of at least one PUFA e.g. eczema, burned or dry skin, acquired immune deficiency syndrome (AIDS), multiple sclerosis or inflammatory skin disorders. Products produced in the method of the invention are useful in pharmaceutical and nutritional compositions, animal feeds and cosmetics. The invention is also useful in gene therapy. The present sequence is a PCR primer used to isolate omega-3 desaturase gene from Saprolegina diclina
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a method of inhibiting corneal allograft rejection, by contacting the allograft with a topical formulation comprising an antisense oligomuclectide targeted to intercellular adhesion molecule-1 (ICAM-1), extracellular adhesion molecule-1 (ICAM-1), or vascular cell adhesion molecule-1 (VCAM-1). The oligomuclectide is useful for inhibiting corneal allograft rejection or for preserving a corneal explant ex vivo, where the explant is human. This sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ss; primer; immunosuppressive; antisense therapy; corneal allograft rejection; intercellular adhesion molecule-1; ICAM-1; extracellular adhesion molecule-1; BLAM-1; vascular cell adhesion molecule-1; VCAM-1; corneal explant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ..
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        corneal explant ex vivo, where the explant is human. This s corresponds to one of the oligonucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Length 20;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This is the nucleotide sequence of primer RSP95F1, an antisense primer designed for RT-PCR amplification of Rupestris stem pitting associated virus (RSPaV) dsRNA. It has been used with sense strand primer RSP95R1 (see AAV99301) in RT-PCR amplifications of dsRNA obtained from randomly selected grapwerines (vitis) and 15 grapevine accessions. Oligonucleotide primers (see AAV99294-307) capable of hybridising to a nucleic acid of RSPaV are claimed. They can be used in a method of detecting the presence of RSPaV, such as RSPaV-1 (see AAV99284), in a sample. The invention also provides methods of imparting resistance to RSPaV to plants, especially transgenic Vitis scion and rootstock cultivars
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Isolated proteins from Rupestris stem pitting-associated virus and related nucleic acid - vectors, host cells and transgenic Vitis cultivars

The method comprises preparing a reduced complexity genome (RCG) from the genomic sample and analysing the RCG for the presence or absence of a sallele. The method can be used to characterise a tumour, to generate a genomic pattern for an individual genome or to generate a genomic classification code for a genome. The method can be used to assess whether a subject is at risk for developing a disease or to identify a set of SNP alleles associated with a disease. The method can also be us to perform linkage analysis. AAA35944 to AAA35947 represent sequences used in the exemplification of the present invention. AAA35948 to AAA36532 represent nucleotide sequences containing SNPs
                                                                                                                                                                                                                                                                                                                                                                                                                               preparation

                                                                                                                                                                                                                                                                                                                     8
                                                                                                                                                                                                                                                                         0
                                                                                                                                                                      The present invention provides nucleic acid molecules capable of downregulating the expression of the human checkpoint kinase-1 (ChkI) gene. These may be antisense or ribozyme sequences, and are useful in the treatment of diseases associated with conditions affected by ChkI levels, including cancer. The present sequence is an oligonucleotide described in the exemplification of the invention
                                                                                                                 Novel nucleic acid molecule e.g., ribozymes or antisense nucleic acid molecules, which downregulates expression of a checkpoint kinase-1 gene, useful for treating colorectal, lung, breast or prostate cancers.

                                                                                                                                                                                                                                                                                                                                                                                                       Human POSHL 1 is a proto-oncogene product that functions as an adaptor protein that interacts with Rho family small GTPases as well as downstream components of the signal transduction pathway. (I) is useful for identifying a specific binding partner. (I) and nucleic acids (II) encoding (I) are useful for diagnosing, monitoring disease and treating caused by altered expression of human POSHL1 including diagnosing and treating caused by altered expression of human POSHL1 including diagnosing and useful in gene therapy. (II) is useful for constructing microarrays which are useful for measuring and for surveying gene expression and creating transgenic ono-human animals capable of producing the proteins. The present sequence is that of a scamming oligomucleotide useful in examples of the invention. Note: The present sequence did not form part of the prince printed specification, but is based on sequence information supplied to
Novel human SH3 domain (POSH)-like signaling protein 1 polypeptide, POSHL-1, useful for treating disorders associated with decreased expression or activity of human POSHL1.
                                                                                                                                                                                                                                                                protein 1 (POSHL 1) polypeptide (I), comprising a sequence of 730 amino acids (S1, ABB83999), a sequence having 65% sequence identity to (S1), (S1) having 95% deviations, especially conservative substitutions or a fragment of the sequences comprising at least 8 contiguous amino acids.
                                                                                                                                                                                                                             The invention relates to an isolated SH3 domain (POSH)-like signalling
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human, POSHL 1; SH3 domain; POSH-like signalling protein 1; oncogene; Rho GTPase; signal transduction; gene expression; cancer; vaccine; gene therapy; transgenic; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

The invention relates to an isolated SH3 domain (POSH)-like signalling protein 1 (POSHL, 1) polypeptide (I), comprising a sequence of 730 amino acids (SL4, ABBB399), a sequence having 65% sequence identity to (S1), (S1) having 95% deviations, especially conservative substitutions or a fragment of the sequences comprising at least 8 contiguous amino acids. Human POSHL 1 is a proto-oncogene/oncogene product that functions as an adaptor protein that interacts with Rho family small GTPases as well as downstream components of the signal transduction pathway. (I) is useful of for identifying a specific binding partner. (I) and nucleic acids (II) encoding (I) are useful for diagnosing, monitoring disease and treating caused by altered expression of human POSHL1 including diagnosing and treating cancer, they useful in the development of vaccines and (II) is useful for measuring and for surveying gene expression and creating transgenic non-human animals capable of producing the proteins. The present sequence is that of a scanning oligomucleotide useful in examples of the invention. Note: The present sequence did not form part of the privant by the European Patent Office ö Novel human SH3 domain (POSH)-like signaling protein 1 polypeptide, POSHL-1, useful for treating disorders associated with decreased expression or activity of human POSHL1. The invention relates to the isolation of 6327 nucleotide sequences, fragments of at least 15 consecutive nucleotides of these nucleotides, a sequence having at least 80% identity, after optimal alignment, with the nucleotides, a sequence that hybridizes under stringent conditions with the nucleotides, or the complement, or corresponding RNA, of the nucleotides. The nucleotides are used as probes or primers for detecting, identifying, quantifying and/or amplifying nucleic acids, as in vitro sense and antisense sequences, of nucleotides involved in tumour suppression or reversion, apoptosis and or viral resistance, to produce recombinant polypeptides, and to prepare transgenic animals, as experimental models. The nucleotides (also vectors containing them and calls containing the vectors), the encoded polypeptides and antibodies of viral infections or diseases characterized by development of tumours or viral infections or diseases characterized by development of tumours and/or prognosis of these diseases. The nucleotides can be used for diagnosis also be used to screen for their specific interactive molecules, and/or prognosis of these diseases. The nucleotides and polypeptides can be used to screen for their specific interactive molecules, and/or prognosis of the expression of the nucleotides and polypeptides can be used to screen for their specific interactive molecules, and/or prognosis of the expression of the nucleotides and polypeptides can be used to screen for their specific interactive molecules, and/or prognosis of the expression of prognosis and polypeptides can be used to screen for their specific interactive molecules, and/or prognosis of the molecules and polypeptides can be used to screen for their specific interactive molecules.
                                                                                                                                 New nucleic acid encoding human prostate membrane-specific antigen, useful e.g. for treatment of tumors and viral infection, also related polypeptide and antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                            Disclosure; Page 512; 771pp; French.

Testing for disease-associated p53 gene mutation(s) using a hierarchy of assay techniques - e.g. immunoassay, DNA amplification and DNA sequencing.

```
Claim 11; Page 26; 44pp; English.
```

in a hierarchy of increasing accuracy and cost per tool, in which each tool detects essentially no false positives. Tests that may be employed, in order of increasing accuracy and cost per tool, in which each in order of increasing accuracy and cost are: (a) immunoassays, (b) DNA fragment length/quantity analysis, and (c) DNA sequencing of regions most likely to harbour point mutations. AAT08667-85 are primers used in DNA sequencing analysis. The primers are generally nested inside the amplification primers (AAT08645-66), i.e. closer to the exon, although in some cases the preferred sequencing primer is in fact the amplification primer. The sequencing primer is only gated to a fluorescent mol. such as fluorescent mol. such as fluorescent in a conjugated to a fluorescent mol. such as the present sequence is used to effective diagnosis of disease-associated mutations in the sequence the antisense strand of exon 5 Rapid and cost

clk-1 gene - used to obtain human clk-1 cancer diagnosis. New Caenorhabditis elegans clk-1 sequence, useful for, e.g. cance

Disclosure; Page 15; 46pp; English.

SHP59 in a nested PCR reaction to amplify the Caenorhabditis elegans clk-1 cDNA. The invention provides the C. elegans clk-1 protein (AAMS6670) which is involved in the developmental rate and longevity at the cellular physicalogy level, where clk-1 mutants have a longer life and altered cellular metabolism relative to wild-type. The clk-1 gene may be cloned to identify related genes, for e.g the human clk-1 sequence can be identified and may be useful in the diagnosis and/or prognosis of cancer. The invention claims that downregulation of expression of clk-1 can be Primer SHP57 (AAV30208) was used with primer SHP58 (AAV30209) and primer

claims that if downregulation clk-1 expression could be targeted to a particular tissue or organ, it could lead to a specific physiological slowing down of this tissue/organ and a concomitant slower rate of degradation by the ageing process. Alternatively, administration of an agent to promote tissue or organ-specific overexpression of clk-1 could allow the physiological rates of tissues or organs to be increased, to treat pathological conditions causing a slowdown of physiological rate of tissues/organs in a patient The invention also increase the life span of animals or humans. 5555555555<del>%</del>8

Antisense oligonucleotides targeted to nucleic acids encoding human tumor necrosis factor receptor-associated factor (TRAF), useful for treating diseases associated with TRAF expression such as inflammatory diseases.

Example 17; Page 56; 170pp; English

administering an antisense oligonucleotide. The reduction of jun kinase activation in cells comprises contacting the cells with an antisense oligonucleotide targeted to TRAF-6. A method for the reduction of E-selectin expression in cells or tissues comprises contacting the cells or tissues with an antisense oligonucleotide targeted to TRAF-2 or TRAF-6. The antisense oligonucleotides have antiproliferative and anti-inflammatory activity and are useful for treating disorders associated The present invention relates to antisense oligonucleotides (see AAA55496
-A55757) which are targeted to nucleic acids encoding a human tumour
necrosis factor receptor-associated factor (TRAF). The antisense
sequences comprise at least one modified internucleotide linkage, which
is a phosphorothioate linkage. The oligonucleotides also include at least
one modified sugar moiety such as a 2'-O-methoxyethyl sugar moiety.
Sequences AAA55490-A55495 represent nucleotide sequences encoding human
TRAFI-6. Included in the invention is a method for treating a human
having a disease associated with the expression of TRAF comprising

pharmacokinetic assay; pharmacodynamic assay; toxicology; serum albumin; alpha-acidic glycoprotein; CYP; multidrug resistance protein; MRP; uridine diphosphoglucuronosyl transferase; UGT; cytochrome P450.

This invention relates to a transgenic non-human animal which may be used for assessing the behaviour and/or metabolism of a drug in another animal and which expresses a foreign polypeptide associated with drug behaviour and/or metabolism. The invention also comprises a nucleic acid construct for use in producing the above transgenic non-human animal and a method of assessing the metabolism and/or behavior of a drug in an animal of interest, comprising administering a test agent to the transgenic animal and conducting analytical tests to determine drug metabolism and/or behaviour. The transgenic animal is useful in studying drug metabolism and/or behaviour in other animals. The nucleic acid construct is useful in producing the above transgenic animal and the methods are used for producing, breeding and using transgenic animals for pharmacological (e.g. pharmacokinetic or pharmacodynamic assays) and/or toxicological studies. Nucleic acid sequences used within the invention are serum and the control of the contro
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

PCR primers AAZ01426-Z06209 were used to amplify open reading frames (ORFs) of the genome of Chlamydia trachomatis (see AAZ01425). These ORFs encode polypeptides (see AAY36754-Y37949) which can be used as vaccines against Chlamydia trachomatis. Antisense and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases such as conventional trachoma, nonendemic trachoma, paratrachoma, and inclusion conjunctivitis; genital diseases such as nongonococcal uretritis, epidymitis, cervicitis, salpingitis, perihepatitis, bartholinitis, pheumopathy in breast feeding infants; and venereal lymphogramulomatosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human biallelic marker upstream amplification primer SEQ ID NO:4532

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              PCR primers AA201426-Z06209 were used to amplify open reading frames (ORFS) of the genome of Chlamydia trachomatis (see AA201425). These ORFs encode polypeptides (see AAY3674-Y3749) which can be used as vaccines against Chlamydia trachomatis. Antisense and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases such as conventional trachoma, nonendemic trachoma, paratrachoma, and inclusion conjunctivitis; genital diseases such as nongonococcal uretritis, epidymitis, cervicitis, salpingitis, prihepatitis, bartholinitis; promeumopathy in breast feeding infants; and venereal lymphogramulomatosis. The polypeptides of the invention may be of use in treating these
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Vaccine; eye disease; conventional trachoma; nonendemic trachoma;

invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ69579 to AAZ77440 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the differential efficacious responses to and side effects from pharmaceutical agents acting on a disease as well as other treatment.

Anti-human Fas humanizing antibody-containing antirheumatic agents. 

Example 4; Page 21; 109pp; Japanese.

The present invention relates to antirheumatic agents which comprise as active ingredients an immunoglobulin M (IgM) protein. The IgM protein does not include a J segment, has apoptosis inducing activity, and consists of a light and heavy chain polypeptide produced synthetically. The agents of the invention exhibit antirheumatic and immunosuppressive activity and can be used to treat autoimmune diseases, especially rheumatism. The IgM molecule used in the invention has human Fas-antigen

```
the IgM light and heavy chains (see AAA78267-A78272) and the corresponding protein sequences (see AAB12913-B12918 and AAB12919), and nucleotide sequences of the humanised anti-human Fas 1g CH11 (see AAA78202-A78206) and protein sequences (see AAB12908-B12910). Also included are anti-human Fas antibody CDR peptides (AAB12902-B12907). Primers specific for the anti-human Fas antibody, light, heavy and kappa chains used in the invention are represented by sequences AAA78213-A7826. Primers used for sequencing the human Ig DNA used in the invention are represented by sequences AAA78277-A78318 and AAA78335-A78337, while humanised anti-Fas Ig DNA sequencing primers are represented by sequences AAA78211-A78318 and AAA78338-A78367. Primer represented by sequences ABA78211-A78318 and AAA78338-A78367. Primer represented by sequences ABA78211-A78318 and AAA78338-A78367. Primer broduction of the agent of the invention
                                                                                                                                                                                                                                                                                                                                                                               o;

The antisense oligomucleotides of the invention are used to treat a person suspected of having or being prone to a disease or condition a human DDB2/p48 expression. The present DNA sequence represents a human DDB2/p48 antisense oligomucleotide of the invention. NOTE: The present DNA sequence is a 2'-0-methoxyethyl gapmer and contains a phosphorothioate backbone
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Antisense oligonucleotide which specifically hybridizes with a region of a nucleic acid encoding human Damage-specific DNA binding protein p48, useful for treating diseases and conditions associated with p48
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention comprises antisense oligonucleotides targeted to the human damage specific DNA binding protein 2 (DDB2 - also known as p48) gene, located on chromosome 11. DDB2 is a subunit of the the DDB protein which
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

The present invention describes a method of arraying genome clones. The method comprises: (a) clones of the genomic libraries contained in multiwell plates numbered for discrimination are mixed in each of the multiwell plates; (b) a primer designed based on the chromosome marker sequence is added to the mixture to carry out an amplification reaction; (c) a signal orresponding to the marker is detected from the resultant amplified product to specify the discrimination Nos. of the multiwell plates of the marker is changed so that the same discrimination Nos. succeed to the maximum in the specified discrimination Nos. to array the multiwell plates; (e) the clones in the multiwell plates of the specified discrimination Nos. to array the multiwell and altered directions; (f) the mixed clones are cultured and the resultant cultures are amplified products; (h) the clones in the multiwell plates are specified from the amplified products; (h) the clones in the multiwell plates are specified from the amplified products; (h) the clones in the multiwell plates are specified from the amplified products; (h) the clones in the multiwell plates are specified from the amplified products; (h) the clones in the multiwell plates are specified from the amplified products; (h) the clones in the multiwell mixed reconstituted as the positions on the chromosome and arrayed. The clones are mixed for the maximum and arrayed. The mixed mixed for the maximum and arrayed the positions on the chromosome and arrayed. The more array is useful for gene analysis. NaMayassa to a plate and arrayed the more arrayed the more arrayed the more arrayed.

Novel antisense compound, specifically hybridizing to and inhibiting the expression of Inhibitor of DNA binding-1, useful for treating hyperproliferative, immune, muscular, vascular or pancreatic disorder.

Example 15; Page 82; 105pp; English.

The invention relates to novel antisense compounds (I) 8-30 nucleobases in length targeted to a nucleic acid molecule encoding Inhibitor of DNA binding-1, where (I) specifically hybridises with and inhibitor of DNA binding-1. Antisense inhibition of human captression of Inhibitor of DNA binding-1. Antisense inhibition of human colliquous colliquous and a decay gap was tested. A series of oligonucleotides were designed to target different regions of the human Inhibitor of DNA binding-1 RNA. The compounds were analysed for their effect on human Inhibitor of DNA binding-1 RNA. The compounds were analysed for their effect on human Inhibitor of DNA binding-1 RNA. The compounds were analysed for their effect on human Inhibitor of DNA binding-1 RNA. The result showed that the oligonucleotides showed at least 25% inhibition of human Inhibitor of DNA binding-1 expression. (I) is useful for treating a human having of Inhibitor of DNA binding-1 in cells or tissues by contacting the cells or tissues with (I). (I) is also useful for treating a human having a disease or condition associated with corporphiactically effective amount of (I), where the disease or condition is a hyperproliferative disorder. (I) may also be used for diagnostics, therapeutics, prophylaxis (e.g., to prevent or dealay cinfection, inflammation or tumour formation), and as research reagents and kits. (I) may be safely and effectively administered to humans. The present sequence represents a human Inhibitor, the DNA binding-1, antisense or continued the continued of the oligonucleotide used in the method of the invention

The invention relates to novel antisense compounds (I) 8-30 nucleobases in length targeted to a nucleic acid molecule encoding Inhibitor of DNA binding-1, where (I) specifically hybridises with and inhibits the expression of Inhibitor of DNA binding-1. Antisense inhibition of human inhibitor of DNA binding-1 (2-mORE) wings and a deoxy gap or series of oligonucleotides having 2-methoxyethy1 (2-mORE) wings and a deoxy gap was tested. A series of oligonucleotides were designed to target different regions of the human Inhibitor of DNA binding-1 RNA. The compounds were analysed for their effect on human Inhibitor of DNA binding-1 RNA. The binding-1 mRNA levels by quantitative real-time polymerase chain reaction (PCR). The result showed that the oligonucleotides showed at least 25% inhibition of human Inhibitor of DNA binding-1 in cells or inhibition the expression of Inhibitor of DNA binding-1 in cells or tissues by contacting the cells or tissues with (I) is also useful for treating a human having a disease or condition associated with Novel antisense compound, specifically hybridizing to and inhibiting the expression of Inhibitor of DNA binding-1, useful for treating hyperproliferative, immune, muscular, vascular or pancreatic disorder. ubiquinone

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5 or 3 end genomic flanking regions, 5 and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or masal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition is useful for treating or use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also

\$\$\$\$\$\$\$\$\$\$\$\$\$\$

for enhancing the prophylactic or therapeutic respiratory effect of an antinflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject's tissue, or treating bronchoconstriction, lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPPO at ftp.wipo.int/pub/published_pct_sequences
